

SOR® Mechanical Level Switches

are rugged, industrial products specifically designed for versatility of application. This catalog contains application and ordering data for float and displacer-operated level switches. Switches are available with flanged or sealed chambers or as direct insertion models.

Options available for each type of switch include: switch type and quantity, housing type, chamber material, process connections, accessories, and more. Units may be customized to suit customers' needs.

Inside this catalog you will find solutions to your level sensing puzzles. SOR mechanical level switches have many configurations available. If you don't see what you need, we will engineer a custom solution for your application.

- Features and Benefits
- Five-year warranty
- ASME Section IX and AWS qualified welding system
- Designed to ASME B31.1 and B31.3 guidelines
- Hermetically sealed switching mechanisms available
- Stainless steel switching mechanisms
- High-temperature capability (up to 1200 °F)
- Wide variety of explosion-proof housings
- Versatile switching mechanisms which retro-fit into other manufacturers' units

- Worldwide listings and certifications
- Quick worldwide delivery
- ASTM grade materials with certified mill test reports used
- Safety Certified to IEC 61508 (SIL) SOR products are certified to IEC 61508 for non-redundant use in SIL1 and SIL2 Safety Instrumented Systems for most models. For more details or values applicable to a specific product, see the Safety Integrity Level Quick Guide (Form 1528).
- EU Directive 2014/68/EU (PED) available

Standard Chamber Materials	with full materia materials. Copie	All SOR level switch chambers are constructed using ASTM grade materials with full material certification. Mill Test Reports are kept on file for all raw materials. Copies are available upon request at the time of order placement. Consult factory for alternative chamber materials.

Float-Operated Level Switches - Vertical

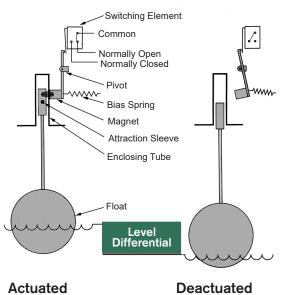

Model Series 100, 200 and 300

The float rides on the process liquid surface, precisely tracking liquid surface motion.

Rising liquid level lifts the float, sliding the attraction sleeve up inside the enclosing tube and into the magnetic field to actuate the electrical or pneumatic switch (signaling liquid presence).

Subsequently, falling liquid level lowers the float, drawing the attraction sleeve out of the magnetic field to deactuate the electrical or pneumatic switch (signaling liquid absence). Float-type level switches are generally able to handle high-temperature applications, and sometimes prove useful for close interface detection.

Floats can operate up to two switching elements. Independent switching levels may be obtained with tandem floats. **Consult the factory for special float-switching arrangements.**

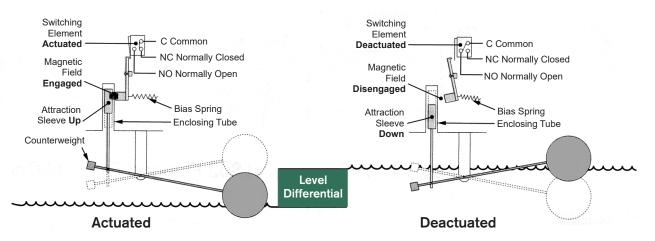

Float-Operated Level Switches - Horizontal Model Series 108/208 and 400

The float rides on the process liquid surface, precisely tracking liquid surface motion.

Rising liquid level lifts the float via a pivot mechanism, sliding the attraction sleeve down inside the enclosing tube and out of the magnetic field to deactuate the electrical or pneumatic switch (signaling liquid presence).

Subsequently, falling liquid level lowers the float, drawing the attraction sleeve into the magnetic field to actuate the electrical or pneumatic switch (signaling liquid absence). Float-type level switches are generally able to handle high-temperature applications.

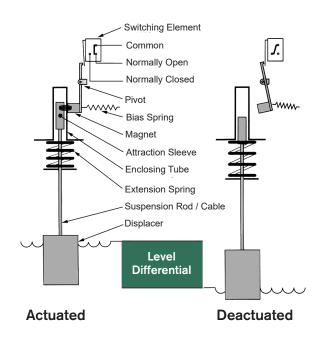

Displacer-Operated Level Switches Model Series 700, 730, 740, 750 and 800

Displacer controls offer alternative features to the float-operated control. The sensor is a weight (displacer), heavier than the liquid, that is suspended by a spring. When liquid contacts the displacer, a buoyancy force is produced, which causes the effective weight of the displacer to change. This causes the spring to retract slightly to a new equilibrium position. When the spring retracts, the attraction sleeve also moves upward into the field of the external magnet, thus overcoming the force of the bias spring and actuating the switching element.

This principle provides for narrow or wide switching differential, and allows switching point alteration by moving the displacer(s) up or down the suspension cables.

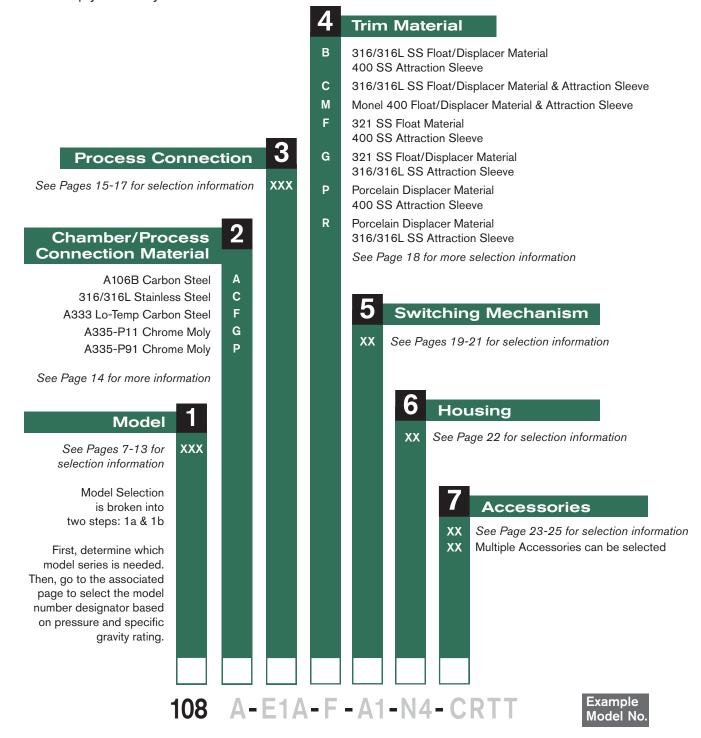

Displacers may be arranged in combinations of narrow and wide differential to operate up to three switching stages. Displacer controls operate under higher pressure conditions than float-operated switches.

How to Order

Below is the SOR quick select model number tree that provides you with options to configure and order a product for your application.

- You must select a **designator** for each component (see corresponding pages)
- Reference tables, charts and additional information are provided throughout the catalog to help you make your selections.

WWW O

7/48

The first step to creating your model number is to determine whether a float or a displacer-based level switch is needed. See below for the different options for selecting the right technology for a specific application.

Float Selection

Float switches are inherently less expensive as they have a very simple operating mechanism compared to displacer technology. Because of this, they can operate extremely well in high temperature applications. The performance and functionality of a float switch are unaffected by changes in process conditions such as temperature, pressure, and dielectric properties. Floats however have limited pressure and SG capabilities compared to displacer technologies.

Displacer Selection

Displacer based type level switches have high pressure capabilities and can be used for level control and interface detection. Because it operates as a force balance, displacers can achieve lower SG capabilities than float based technologies. Displacer technologies are limited by temperature as the higher temperatures change the properties of the spring used as a counterforce of the displacer.

Model Series	Application		Model Series	Application	
100 Series Flanged Serviceable External Chamber Float Switch (p. 8)	 Indirect mount is required because tank cannot be easily shutdown for service When turbulence is high enough to cause false readings/damage to the float Flanged service connection for maintenance, cleaning, or troubleshooting 		741-743, 802 Flanged Serviceable External Chamber Displacer Switch (p. 11)	 Indirect mount is required because tank cannot be easily shutdown for service When turbulence is high enough to cause false readings/damage to the displacer Flanged service connection for maintenance, cleaning, or troubleshooting 	
200 Series Sealed Non- Serviceable External Chamber Float Switch (p. 9)	 Indirect mount is required because tank cannot be easily shutdown for service When turbulence is high enough to cause false readings/damage to the float The chamber is welded to prevent tampering and is lower cost 		740, 804 Sealed Non- Serviceable External Chamber Displacer Switch (p. 11)	 Indirect mount is required because tank cannot be easily shutdown for service When turbulence is high enough to cause false readings/damage to the displacer The chamber is welded to prevent tampering and is lower cost

Step 1b: Model Selection Pressure Rating & Specific Gravity

108 A-E1A-F-A1-N4-CRTT

Using selected Model, refer to the charts on pages 8-13 to match required pressure rating and specific gravity, based on design temperature. Once model number has been selected, go to page 14 for Step 2. **Consult factory for ratings of alternative chamber materials.**

- - -

100 Series Float operated with a flanged, serviceable external chamber.

* Consult the factory for pressure ratings and minimum SG of units with Monel trim.

** Insertion depth is defined as the approximate value of a rising level setpoint at a Specific Gravity of 1.0. If more precise setpoint action is required, please select the SC option from the accessories section of the catalog. **Note:** An insertion depth or SC information must be supplied at the time of order on all 300 series switches.

400 Series Float-operated and suitable for horizontal-insertion mounting.

Select the internal trim material from the chart below.

Note: Consult the factory for pressure ratings on Monel trim. Standard displacer spring material is Inconel 600.

108 A-E1A-F-A1-N4-CRTT

SOR switching mechanisms are designed for use in harsh industrial atmospheres. SOR offers a variety of electrical and pneumatic switching mechanism types to fit a wide range of applications. The basic types of switch mechanisms available are listed below. See page 20 for specifications.

All SOR switching mechanisms are constructed from stainless steel and other durable manufactured materials. Each mechanism is individually calibrated and inspected to insure accuracy and repeatability. See below for the benefits and application of each switch type. All mechanisms are interchangeable with most competitor units.

Types A, B, C, E; Standard Dry-Contact Switches

Standard dry-contact switches have open mechanisms and exposed switching elements. These switching mechanisms are easy to maintain. Visual confirmation of operation is obvious. Dry-contact switch mechanisms are recommended for most level switch applications and are available in SPDT and DPDT switch arrangements.

- High-load carrying capacity
- High-quality phenolic insulator
- Vibration resistance
- Versatility of application

Types F, G, H; Hermetically Sealed Switches

Hermetically sealed switches are entirely enclosed in a hermetically sealed enclosure. Both switching elements and mechanisms are sealed. Good for volatile atmospheres and low temperatures.

- Completely enclosed switching mechanism and switch contacts
- Long-term reliability in harsh environmental conditions
- Vibration resistance

Types L, S, T, V; Mini-Hermetically Sealed Switches

Mini-hermetically sealed switches have a hermetically sealed switch element on an exposed mechanism. Good for high-temperature service and normal applications that require hermetically sealed contacts.

- Rugged stainless steel construction
- Class I Group A rating for use in hazardous areas
- Vibration resistance
- High operating temperature limits

Types D and R; Anti-Vibration Switches

Anti-Vibration Switches employ two magnets to provide vibration protection. Dual magnets prevent false trips by providing a positive mechanical lock to the enclosing tube when the switch is in any position. (Type T switches are mini-hermetically sealed units with dual magnets.)

Type J: Pneumatic Switch

Pneumatic switches are available for applications that prohibit electrical switching or where electricity is not available.

- Three-way aluminum valve
- Anti-vibration design
- 1/4" NPT ports in 316SS for additional corrosion resistance

Type Y: Extra-High Temperature Switch

The Y Series level switch mechanism is designed to operate normally under extremely high-temperature conditions. Constructed of stainless steel, ceramic, and oxidation-resistant alloys, the Y Series is designed to counteract the warping and seizure normally associated with this type of mechanism in high temperatures. The Y Series switch is especially well suited for power plant conditions.

- Mica/glass insulation on wires and switches
- Stainless steel and ceramic switch element and terminal block
- Switch mechanism rated at 800°F (427°C) continuous process temperature
- Can be combined with external temperature protection to function in temperatures up to 1200°F (649°C)
- Dual magnets for vibration protection

Notes

1. Minimum ambient temperature at which the switch mechanism will operate normally. This may vary according to actual climatic conditions. Actual minimum process temperature may be much lower. Consult the factory for details.

2. Maximum process temperature at which the switch mechanism will operate normally. This can be increased according to the type of process. Refer to pages 25-26 for more details.

- 3. -40°F Temperature rating with no icing.
- 4. Pneumatic switches must be used with clean, dry air or gas.
- 5. These switch designators have higher current rating for SPDT than DPDT.

6. Manufacturer specifications state maximum operating humidity must be <85% and minimum power rating is 100mW.

7. For high humidity environments and low current (<100mA), use hermetically sealed gold contact switches (S & G switches). For high temperatures, high humidity, and low current, a "V" switch is available with gold contacts upon request.

Step 5: Switching Mechanism

108 A-E1A-F-A1-N4-CRTT

Notes

1. These switches use two magnets and must be considered dual mechanisms when figuring minimum specific gravity.

2. Pneumatic switching mechanisms must be specified with P1 housing.

108 A-E1A-F-A1-<u>N4</u>-CRTT

SOR housings are designed to protect the switching mechanisms from harsh environmental conditions, as well as protecting the surrounding atmosphere from potential ignition sources. The basic types of housings are listed below.

General Purpose, NEMA 4x Housings

- Heavy duty cast aluminum
- All housings are rated NEMA 4x (IP66) as a minimum

Explosion-Proof Housings

- Available in aluminum or cast iron
- Ratings as shown in chart below

Pneumatic Switch Housings

- Required for use with a pneumatic switching mechanism
- General Purpose, NEMA 4 (IP66) only

model number builder

Step 6:

Housing

Switch Housings Select the housings from the chart below

			tic Enclosure Rating ²		ļ	Appro	ovals	5		Available with Mod					els

Notes:

C/F = Consult the Factory 1. Pneumatic switching mechanisms only (P1)

2. Consult switch and housing sections for agency availability.

CY or CZ option may be required for CRN, see Page 24. З.

Process media must be known prior to manufacture. Different processes (service categories) require different quality

inspection procedures. Consult the factory for details.

Need connection size, type, and location on chamber.
 See high-temperature selection for application, Pages 26-27.

The upper & lower specific gravity required to determine functionality. Appropriate for Model Series 701 through 704 & 730 through 733. See page 28 for details. Not available with NACE. 7. 8.

No MT option on Stainless Steel 9.

Operating specific gravity, Set Point (referenced from upper process connection) and if Set Point is rising or falling are required.

11. Specific details of chamber dimensional changes.

Length of cable required (10 ft. is standard).
 Requires S3, S8 or T6 Housing.

Step 7: Accessories/Certificates

24/48 Registered Quality System to ISO 9001 | 913-888-2630 | SORInc.com

SOR level switches can accommodate high-temperature applications up to 1200°F (649°C). These temperatures may be safely reached by a proper combination of chamber material, switch mechanism and temperature extension. Refer to page 26 to select the proper components for your process temperature.

ET Accessory

The straight temperature extension provides physical distance between the process and the switching mechanism. It is constructed of a straight piece of pipe welded between the chamber and enclosing tube connection.

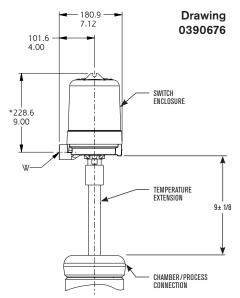

How It Works

The straight temperature extension is designed to remove the switch from direct radiant heat in dry heat processes. Consult the chart on page 26 for application.

To Specify

Add Accessory Designator ET to the end of the SOR level switch model number per the selection chart on page 26.

The ET accessory automatically matches the material and rating of the specified level switch chamber. This option can be supplied on SOR level switches 100, 200, 300 and 400 Series.

FE Accessories

The finned temperature extension is designed to protect the electrical portion of a level switch from heat damage due to condensing processes. When used in combination with high-temperature switch mechanisms, this option allows operation in process temperatures up to 1200°F (649°C).

How It Works

The finned temperature extension condenses process steam and reduces its heat before it can reach the switching mechanism. The design reduces steam to its saturation temperature in the enclosing tube, protecting the switching mechanism from deterioration due to high temperatures. The process pressure dictates the saturation temperature, see page 32.

To Specify

Add Accessory Designator FE to the end of the SOR level switch model number per the selection chart on page 26.

The finned temperature extension automatically matches the material and rating of the specified level switch chamber. These options can be supplied on SOR level switches 100, 200,108/208, 300 and 400 Series.

Note: For proper cooling, temperature extensions must not be insulated or placed inside an enclosed structure. High ambient temperatures (over 100°F/38°C), intense direct sunlight, or heat loading from adjacent piping or vessels will affect cooling performance. Consult the factory if any of these conditions exist.

Fundamental differences in condensing (steam) and non-condensing (dry) heat require different methods of protection.

Steam Heat processes carry it's heat with the vapor. These processes effectively heat every portion of their enclosure. To reduce the heat effects of condensing processes, we must either condense or physically block the vapor. SOR uses a condensing system to avoid the sealing problems associated with blocking the steam.

Dry Heat processes transfer heat through direct conduction. Heat is only passed to the areas where they touch the enclosure. Therefore, radiant heat is the only concern with these processes. This may be resolved by adding distance between the process and the protected portion of the control.

Using the charts below, find your desired maximum temperature and select a corresponding chamber material. In the process type chart, select a switch mechanism based on whether you are using Steam Heat or Dry Heat. The symbol will indicate if a temperature reduction device is required.

High Temperature Selection Chart

For proper cooling, temperature extensions and finned extensions must not be insulated or placed inside an enclosed structure. High ambient temperatures (over 100°F/38°C), intense direct sunlight or heat loading from adjacent piping or vessels will affect cooling performance. Consult the factory if any of these conditions exist.

Float Switch Pressure Ratings (in psi) above 450°F (232°C). Higher temperatures
available with other materials. Consult factory.

		Pressure at Listed Temperature in psi						
Model	Material	500°F (260°C)	550°F (288°C)	600°F (316°C)	650°F (343°C)	700°F (371°C)	750°F (399°C)

CS = A106B Carbon Steel

SS = 316/316L Stainless Steel

Manual Check (MC) and Tru-Check (TC) options permit manual actuation of vertical displacer level switches, addressing EPA and OSHA safety requirements. The standard 30-foot stainless steel chain allows manual actuation from the tank base, eliminating potentially hazardous trips to the top of the tank. Specify either an MC or TC option by placing the designator in the accessory section of the model number.

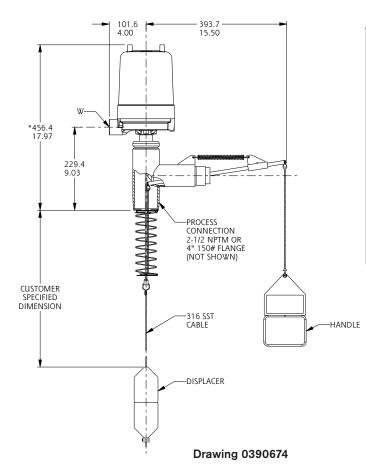

Designator	Application
TC	Tanks or vessels pressurized to 100 psi
MC	Atmospheric vented tanks or vessels

These options are available on SOR level switch Series 701 through 704 and 730 through 733. MC and TC option available on carbon steel units only. Series 730 through 733 are more sensitive to both high and low SG values. Please consult factory before ordering the MC or TC options for these models.

How It Works

Pulling the handle transfers downward motion to the actuator lever by means of the beaded stainless steel chain. The resultant motion lifts the entire level sensing assembly which moves the attraction sleeve and actuates the switching element to simulate a high-level condition. Switching action for alarm, shutdown or control is verified.

Dimensions

Product Specifications

Pressure Range TC (Tru-Check) MC (Manual Chec	*0 to 100 psi k) 0 psi (vented to atmosphere)
*Maximum pressure fo is 100 psi with Tru-C	r entire level sensing assembly heck installed.
Temperature Range Wetted Parts	-40 to 300°F (–40 to 150°C)
Ball	Chrome Plated Brass
Seal	Teflon
Spring	Spring Steel
Body	1018 Steel

Design and specifications are subject to change without notice. For latest revision, see www.sorinc.com. Specify either a CY or CZ option in the accessory section of the model number for a certificate of conformance.

Designator	Certificate of Conformance to
CY	ASME B31.1 Power Piping
CZ	ASME B31.3 Process Piping
PD	EU Directive 2014/68/EU (PED)

If certification to B31.3 is required, SOR Inc. must know the fluid category per the chart below. Read the ASME B31.3 Fluid Category Section at the bottom of this page to determine the applicable category. If no category is selected normal category will be assumed.

Units Covered	Visual Examination ¹	Radiographic (X-Ray) RT	Magnetic Particle MT	Dye Penetrant PT	Hydrotest				
Standard Inspection									
All Chambers	100%	0%	0%	0%	1.5 x pressure for 3 minutes				
		CY Option ((ASME B31.1)						
Below 750°F Below 1025 psi	100%	-	-	-					
Below 350°F All pressures	100%	-	-	-	1.5 x pressure for				
350°F - 750°F Above 1025 psi	100%	All butt welds ≥ 2 "	-	-	10 minutes				
Above 750°F All pressures	100%	All butt welds ≥ 2 "	Butt welds \geq 2" all other welds	Butt welds ≥ 2 " all other welds					
		CZ Option ((ASME B31.3)						
Normal Fluid	5%	5%²	-	-					
Category D	Engineering/QA Choice	-	-	-	1.5 x pressure for				
Category M	100%	20% of all welds ³	-	-	10 minutes				
High Pressure	100%	100% of girth/ branch welds	-	-					

Notes

1. In process visual inspection: inspecting pipe bevel prior to welding, check fit-up, check after-tack weld, and check during weld passes. After completion visual inspection: welding and grinding is checked.

2. In process examination may be substituted on a weld-for-weld basis.

3. In process examination supplemented by appropriate NDE (MT or PT) may be substituted on a weld-for-weld basis.

ASME B31.3 Fluid Category

Normal	A fluid service not subject to the following four categories.
Category D	 A fluid service in which all of the following apply: 1. The fluid handled is non-flammable, non-toxic, and not damaging to human skin. 2. The design gage pressure does not exceed 150 psi. 3. The design temperature is between -20°F and 366°F.
Category M	A fluid service in which the potential for personnel exposure is judged to be significant and in which a single exposure to a very small quantity of a toxic fluid, caused by leakage, can produce serious irreversible harm to persons on breathing or bodily contact, even when prompt restorative measures are taken.
High Pressure	Pressure in excess of that allowed by the ASME B16.5 Class 2500 rating for the specified temperature and material group or any piping so designated by the customer.

Pressure Equipment Directive (PED) – Directive 2014/68/EU

If PED is required, SOR inc must know the following to determine EPR Category of the unit.

- 1. Design Pressure.
- 2. Design Temperature Range.
- 3. Process Fluid Group.
- 4. Design Code. Unless otherwise required by the Customer, ASME Section VIII will be the default design code.

Notes

- All units being certified to either PED will also require Material Certificates (MR) and Hydrostatic Test (C2)
- For B31.3 construction and PED compliance, in-process weld inspection will be performed to meet B31.3 requirements.
- If the X-Ray is requested, this will be done in addition to the in-process weld inspection. Since this X-Ray would be
 a customer requirement and not a design code requirement, SOR can use any approved Vendor for this NDE. For
 B31.3 Category M PT (in addition to in-process weld inspection) will be substituted in lieu of X-ray inspection. MT
 may be substituted when the unit's construction is Carbon Steel.

Standard Inspection & Testing Certifications

SOR level switches are available with a wide selection of optional inspection and testing certifications. The section below specifies the SOR standard offering for each option, however inspection and testing can also be provided to meet your specific alternative requirements. Consult the fatory for details.

PMI Report	Alloy verification of wetted parts using x-ray fluorescence (XRF) technology to positively identify the part material used post manufacturing.
Hydrostatic Pressure Test	Process conforms to ASME Section V and is conducted per serial number. If valves are used, hydro testing will be done with valve open and ports plugged.
Visual Inspection Report	Visual weld inspection by certified weld inspector per sales order line item.
Factory Acceptance Test	Summary of testing schedule completed per sales order line item.
Inspection Test Plan	Summary of all the testing processes that will be conducted per sales order line item.
Mill Test Report	Certifies that the listed serial numbers were manufactured using the material on the associated Certified Material Test Reports (CMTR).
Dye Penetrant Examination	Certifies that the listed serial numbers were examined by visible liquid penetrant in accordance with ASME Section V, Article 6.
NACE Compliance	SOR shall provide certification of compliance that the pressure boundary components of the listed serial numbers were manufactured to meet NACE MR0175/ ISO15156.
Ferrite Test	Certifies the Ferrite Number (FN) of 20% of the welds per serial number is documented on associated weld map drawings.
Radiographic Examination (X-Ray)	Certifies the 3rd party radiographic examination of 5% of welds per sales order line item by sample size in accordance with ASME Section V.
Heat Treat	Certifies heat treatment was conducted to ASTM standards per sales order line item.
Mag Particle Examination	Certifies that the listed serial numbers were examined by visible mag particle in accordance with ASME Section V.
Ultrasonic Examination	Certifies that the listed serial numbers were examined by 3rd party ultra sonic examination in accordance with ASME Section V.

Flange Face Finishes

The most common flange face finishes are shown in the table below.

Raised Face Flanges (RF)

All raised-face flange finishes are given as a range. AARH (Average Arithmetic Root Height) values are given with their metric equivalent.

AARH (µin.)	1000-2000	500-1000	250-500	125-250	63-125	32-63	16-32
Ra (µm)	25-50	12.5-25	6.3-12.5	3.2-6.3	1.6-3.2	0.8-1.6	0.4-0.8

Ring Tight Joint Flanges (RTJ)

The side surfaces of RTJ gasket surfaces shall not exceed 63µ" (1.6µm) roughness per ANSI B16.5.

The approximate shipping weights shown below are for standard models. Weights will vary based on pipe size, length and flange size. Consult the factory for the weight of a specific unit.

* Add weights from the table below to the base model weight for VV, VVT, or VH configurations with flanges.

VV, VVT and VH Additional Weights

Size	150#			300#	600#	
Size	pounds	kilograms	pounds	kilograms	pounds	kilograms
1 "	5	2.5	8	4	9	4.5
1-1/2"	8	4	15	7	15	7
2"	12	5.5	16	7.5	18	8.5

Weights shown in this table include two flanges, pipe nipples, and fittings.

Note: Consult the factory for additional weight due to accessories or non-standard requirements.

The specific gravity of water changes depending on its temperature and pressure. The chart below lists properties of saturated steam. Saturated steam is the state where water is in transition between liquid and vapor. The chart provides the process temperature with the associated pressure and specific gravity of the condensate water. If a water application has a high temperature and low pressure, condensate will only be present at the temperature that corresponds to the maximum pressure. Select the proper row based on the temperature and pressure, and read the specific gravity.

Figures are based on saturated steam.

inch (mm)

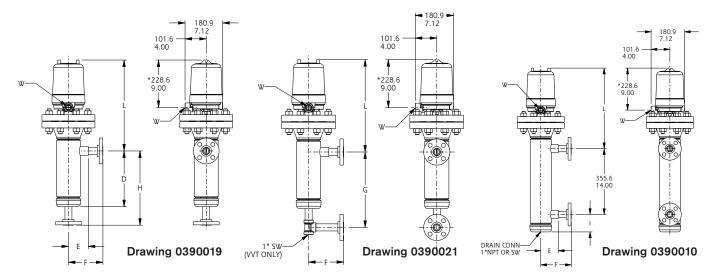

С

inch (mm)

The chart here provides typical standard Set Points. As the specific gravity used on a level switch changes, the Set Points will also change. These values are based on the specific gravity listed and units with "B" trim and an A1 switch. For other materials or switches, please consult factory. If a specific Set Point is needed, please use the "SC" option found in the accessories section of this catalog.

Chamber Dimensions listed are for reference only and are expressed as millimeters over inches. (Linear = mm/in.) They are subject to change without notice. Contact SOR for certified drawings of particular models or if special dimensions are required. "W" designates electrical connection, see page 22 for more housing information.

Notes

1. Dimensions D and E apply to socket-weld connections only. Consult factory for NPT dimensions.

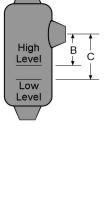

2. Consult factory for dimensions for materials other than carbon steel.

3. Applies to socket weld or NPT process connections only.

4. Consult the factory if weld neck process flanges are required. Dimensions may vary from those shown above.

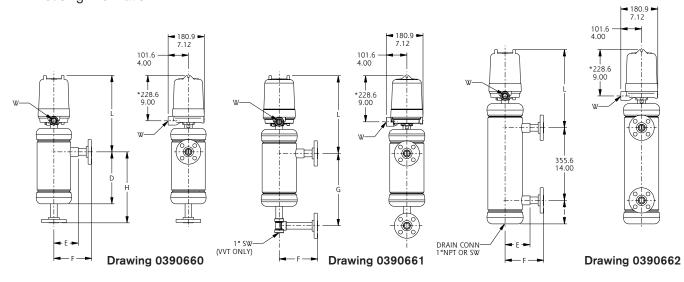

5. Applies to flanged process connections only.

The chart here provides typical standard Set Points. As the specific gravity used on a level switch changes, the Set Points will also change. These values are based on the specific gravity listed and units with "B" trim and an A1 switch. For other materials or switches, please consult factory. If a specific Set Point is needed, please use the "SC" option found in the accessories section of this catalog.

Notes

1. **Standard Units**: It is important to consider the installation configuration when selecting the process connection. Be sure that the float will fit through the process connection, or that the vessel has access to attach the float from inside the vessel after instrument installation. Minimum 5-3/4" (146 mm) overhead clearance required to remove housing cover.

 Tandem Float Units: It is important to consider the installation configuration when selecting the process connection. Be sure that the float will fit through the process connection. Tandem floats are not removable and must be installed through the nozzle opening. Operating specific gravity and insertion depths must be specified. Minimum 5-3/4" (146 mm) overhead clearance required to remove housing cover.

Dimensions in this catalog are for reference only. They may be changed without notice. Contact the factory for certified drawings for a particular model number. Dimensions are expressed as millimeters over inches. (Linear = mm/in.) "W" designates electrical connection, see page 22 for more housing information.

and pneumatic switch, minimum differential will increase. **Maximum Differential (D)** Differential Dimension "D" is calibrated to the minimum shown above as standard. Wider differentials are available by placing an SC in the accessory section of the model number. The shorte below give the maximum differentials available
